Layer 3 Routing Support

The XGS-6350-24X4C enables the administrator to conveniently boost network efficiency by configuring Layer 3 static routing manually, the **RIP (Routing Information Protocol)** or **OSPF (Open Shortest Path First)** settings automatically. The RIP can employ the hop count as a routing metric and prevent routing loops by implementing a limit on the number of hops allowed in a path from the source to a destination. The OSPF is an interior dynamic routing protocol for autonomous system based on link-state. The protocol creates a link-state database by exchanging link-states among Layer 3 switches, and then uses the Shortest Path First algorithm to generate a route table based on that database.

High Performance

The XGS-6350-24X4C boasts a high-performance switch architecture that is capable of providing non-blocking switch capacity and wire-speed throughput as high as **1.28Tbps**, which greatly simplifies the tasks of upgrading the LAN for catering to increasing bandwidth demands.
